

# Mozambique Coastal Breeding Grounds IMMA

## Criterion C: Key Life Cycle Activities Sub-Criterion C1: Reproductive Areas

The coastal waters (between the 20 m-200 m isobaths) of Mozambique are utilised as a mating, calving and nursery ground between July and November each year by the C1 South sub-stock of humpback whales (*Megaptera novaeangliae*) (as recognised by the IWC). Catches from Linga-linga, Mozambique, were unimodal in seasonal abundance with peak catches in July or August (Lea, 1919; Olsen, 1914; Best et al., 1998). The abundance of whales on this ground was estimated (Maputo to Quelimane) at 1954 (CV 0.38) in 1991 (Findlay et al., 1994) and 5,930 (CV = 0.15) in 2003 (Findlay et al., 2011a). The 1991 survey found humpback whales distributed over the entire survey region, although densities were highest between 33°E and 35°30'E (Maputo to Ponta Zavora) over a region of shallow banks (where the southerly Mozambique Current flowed further offshore) and a high density of cow-calf pairs was recorded on the Sofala Banks. Higher than expected sighting frequencies were recorded on the 2003 survey in the regions between Cabo Inhaca and Xai-Xai, between Ponta Zavora and Bazaruto and in the region of the Pantaloon Shoals to the north east of Quelimane, while lower than expected sighting frequencies were recorded over the Sofala Banks (although these densities may be influenced by survey conditions). Cow-calf groups were distributed throughout the survey area. Incidental reports suggest the extensions of this breeding behaviour to the northern Mozambique border. No data are available to identify humpback breeding behaviour outside of the 200 m isobath, but evidence from other breeding grounds suggest this would be unlikely. Despite some photo-identified movement of individuals between Mozambique waters and South African waters, available photo-identification information suggests limited movement between the Mozambique and other Western Indian Ocean coastal breeding areas (for example Madagascar). Such limited exchange is supported by the timing of catch records

### Area Size

80,936 km<sup>2</sup>

### Qualifying Species and Criteria

Humpback whale – *Megaptera novaeangliae*

Criterion C1

### Marine Mammal Diversity

*Delphinus delphis*, *Eubalaena australis*, *Megaptera novaeangliae*, *Orcinus orca*, *Sousa plumbea*, *Stenella longirostris*, *Tursiops aduncus*

### Summary

Between the months of July and November each year, the coastal waters of Mozambique are utilised as a mating, calving and nursery ground for Southern Hemisphere humpback whales (*Megaptera novaeangliae*). Male whales in this area have been recorded singing and observed in competitive groups, and mother-calf pairs are observed throughout the IMMA from the southern border with South Africa to the northern border with Tanzania. Both of the broad shelf regions of southern and central Mozambique, including the Sofala Banks, appear to be priority calving areas. Although the population using this breeding ground appears to be increasing at a healthy rate, this African east coast mainland Breeding Stock (labelled the 'C1 stock' by the International Whaling Commission) appears discrete from the other breeding stocks in the Western Indian Ocean and was heavily targeted by land-based whaling operations between 1908 and 1917.

(Findlay, 2001) and by genetic analyses (Rosenbaum et al., 2009). After severe depletion due to modern whaling between 1908 and 1963 (with few individuals possibly taken from this sub-stock thereafter by Soviet fleets until 1973) (Findlay, 2001), the population has been shown through shore-based monitoring of the migration corridor to be increasing at over 9% per annum (Findlay et al., 2011b). Comparison of distance-based densities suggest a similar considerable increase in the population between the 1991 and 2003 surveys.

## Acknowledgements

We would like to thank the participants of the 2019 IMMA Regional Expert Workshop held in Salalah, Oman for the identification of IMMAs in the Western Indian Ocean and Arabian Seas. Funding for the identification of this IMMA was provided to the Global Ocean Biodiversity Initiative by the International Climate Initiative (IKI). The German Federal Ministry for the Environment, Nature Conservation and Nuclear Safety (BMU) supports this initiative on the basis of a decision adopted by the German Bundestag. Support was also provided by Whale and Dolphin Conservation and the Tethys Research Institute.
